New concept

RM3542A The Evolution is Here

Improved Productivity and Low-impact Measuring

Minimized Variations and Enhanced Measurement Range

RM3542A

An fuller lineup of measurement ranges means that more appropriate ranges and higher resolution testing are now available for your application. The new measurement currents that complement the added ranges ensure detection voltage, improve the S/N ratio and suppress variation.

Achieve Stable Measurements in a Wide Measurement Range

Scaling Function Used to Compensate for Mounted State

New concept

RM3542A

Use the Scaling Function to compensate for the differences in resistance when inspecting individual parts and parts mounted on a board. This function is very useful for inspecting the current detection resistance of low resistors, such as shunts.

Reduce Contact Error Rate and Increase Production Volume

RM3542A

The RM3542A represents an evolution in the Contact Improver Function*1 for low-power measurements. Contact errors are reduced by improved contact between probes and samples.

*1 The Contact Improver Function is described on Page 4.

New concept Low-impact Contact Improvement by Suppressing Rush Current

By suppressing the surge of rush current into samples, there is now a broader range of scenarios in which contact improvement can be used, such as the inspection of small ferrite beads and small 008004-sized(0.25 mm × 0.125 mm) resistors.

Low-impact Measurement of Miniature 008004-sized Parts (0.25 mm × 0.125 mm)

RM3542A

By limiting applied voltage to 5 V or less when measuring, it is possible to measure 008004 size (0.25 mm × 0.125 mm) parts that have a low rated voltage without applying stress.

Consistent Reliability

RM3542A RM3542 Shared Features

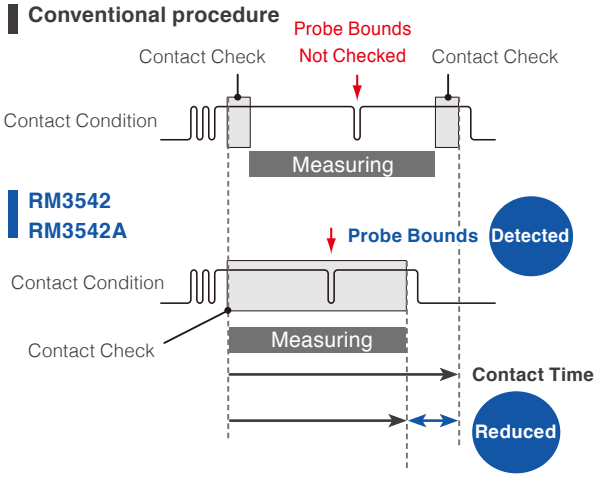
Perfect for Automation

Reliability Improved with Positive Contact

Contact Checking while Measuring

Reliable checking and reduced contact time are achieved by performing contact checks while measuring, instead of before and after, as is traditionally done.

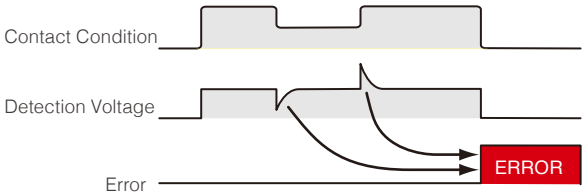
Conventional procedure



Monitor Contact Condition

Detect Contact Errors (Voltage Monitor Function)

Large voltage fluctuations due to changes in current terminal contact resistance or noise from mechanical vibrations are detected as errors.



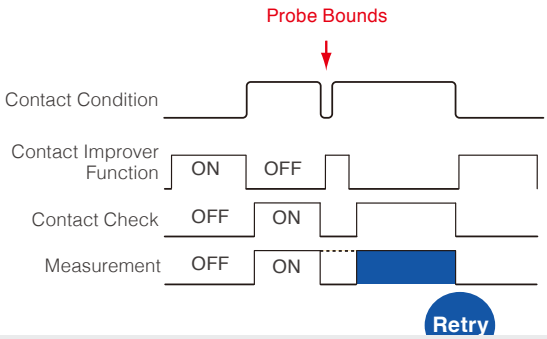
Probe contact chattering
Probe deterioration
External noise

▶ Notification on C.E.Volt display
ERR Notification by outputting a signal

Reduce Contact Error Rate

Repeat Measurement when an Error Occurs (Retry Function)

The Retry Function automatically repeats the measurement when a fault occurs due to probe chatter.

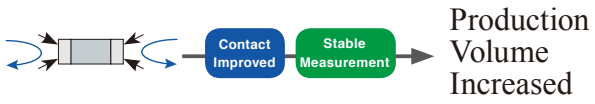


Productivity Improved

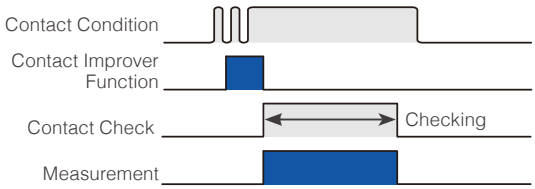
Reduce Contact Error Rate

Contact Improver Function Ensures Quick and Reliable Contact

Contact is improved by penetrating oxidation and impurities between probes and samples. Measurements stabilized by improving poor contact, and a reduction in the contact error rate, lead to improvements in productivity.



Choices for contact improvement current: 17 mA, 25 mA, 35 mA (default value), 50 mA

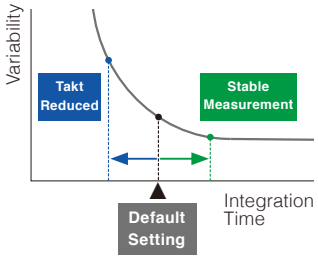


Noise Resistant

Reduce Measurement Time for More Stable Measurements

Integration Time Setting Function

You can set the integration time as desired for each range. Set a short integration time to reduce the takt time, or a long integration time for more stable inspection.

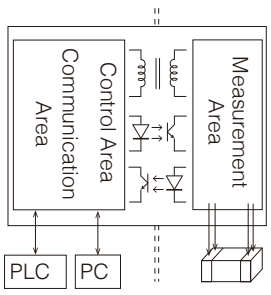


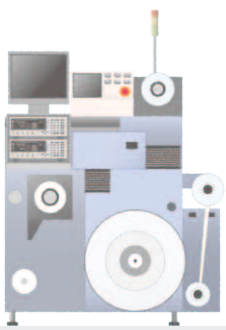
Default Setting

Range	LOW POWER: OFF		
	Integration Time		
	FAST	MED	SLOW
100 mΩ	0.5 ms	5.0 ms	1 PLC
1000 mΩ	0.3 ms	2.5 ms	1 PLC
100 kΩ	0.5 ms	3.0 ms	1 PLC
1000 kΩ	1.5 ms	5.0 ms	1 PLC

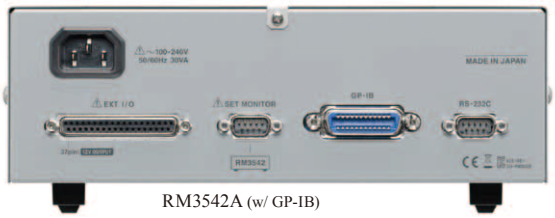
Noise-Resistant Floating Structure

The floating structure of the measurement area minimizes any effects from nearby noise on the measurement values.





Recording, Statistics, Output



RM3542A (w/ GP-IB)

Data Storage Function

Saving to Internal Memory via Trigger Signal or Key Operation

All trigger measurement values during external trigger measurement, or trigger input for measurements during internal trigger settings, are saved to internal memory (30000 Max.).

Auto-Memory Function

Auto [Saving] and [Printing] when Measurement Values are Stable

During internal trigger settings, measurement values can be automatically saved to memory when a probe contacts resistance. When the set number (max. 99) is saved to memory the function stops, statistical calculations are performed, and the data is output to the screen or a printer (RS-232C).
