# HIOKI

# MEMORY HICORDER MR8740T

Perfect for multi-point measurements on high-performance boards 108 Channels of Simultaneous Testing

••• Delivering triple-digit multichannel measurement

Analog 108ch

Analog (96ch) + Logic (48ch) Max. 144ch

Signal generation 216ch

**FS France** Département Teste <sup>8</sup> Meaures 1

## Compact, measures up to 108 channels

### Multi-channel, reduced footprint

The MR8740T achieves testing of up to 108 channels, double that of conventional models, while maintaining the same unit size. Test high-performance ECU boards, with their everincreasing number of test points, with a single measurement system. Make the most of your limited space for testing systems.

## Isolated design for fault prevention

### All channels isolated

Isolation of all channels prevents noise from connected devices, with no negative effect due to different ground potential. Eliminate faults and other trouble caused by mistaken wirings and over-voltages / over-currents due to shorted boards.

MEMORY HICORDER MR8740T

# $\underset{\text{Max. 108ch}}{\text{Max. 108ch}} \times \underset{\text{transfer time}}{\text{Test data}} \neq 0$

As artificial intelligence advances in automobiles and other advanced industries the need for technology to simultaneously process large volumes of data, as well as safety and security, has arrived. The MR 8740 T supports your testing needs with simultaneously sampled measurements across multiple channels.

# Transfer time for test data reduced to almost zero

#### Minimize dead time while testing

Previously, calculations and saving/transferring data after measurements were slow processes, and much of the testing time was taken up by dead time while waiting to perform the next test. The MR8740T dramatically reduces the time both for calculations and saving data, almost completely eliminating dead time while performing tests.

# Save recorded data 100 times faster

# Minimize the time required to save on devices and media

The MR8740T features a brand new interface and faster internal processing, reducing the time required to save measurement data to media. For example, saving that required 10 minutes previously can now be completed in as little as 6 seconds. This saves you the trouble of waiting for data to be saved and improves work efficiency.

### Save data in real time NEW

# Save data while measurement is ongoing

The MR8740T saves data in real-time to recording media while measurement is ongoing thanks to a combination of high-speed data transfer performance and high-speed data saving performance. For example, if saving data to the internal SSD, the instrument can save 64 channels of data in real time at a sampling rate of 1 MS/s.

# Applications

### **Control simulation**

Generating and measuring signals with a single device eliminates the need to prepare separate measurement and generator devices. Simulated output of various sensor signals and control pulse signals allows you to simulate the test waveforms (DC output, sine wave output) of engine controls for automobiles, high speed trains, and airplanes, and control boards for airbags, brake systems, power steering, and active suspension.

Airbag control test

Brake system control test

Engine control test

### Tests using distortion measurements

Input the analog signal from a strain gauge or extensometer and the analog signal from a stress sensor. Use the scaling function to convert those values to tensile strain, and to convert the stress sensor value to tensile stress. Measure analog and logic at the same time, to simultaneously record a variety of signals with a single test.

Monitor infrastructural deterioration in bridges

Measure stress in moving parts of

Multi-point measurement of propellers on

# **ECU Testing**

ECUs are connected to a large number and wide variety of sensors. Add a signal generation unit to simulate these sensors. By measuring the simulation results with a measurement unit at the same time, you can perform all steps from signal generation to measurement with a single MR8740T.

The U8794 also offers resistance output to enable thermistor circuit testing.

### Replace multiple DMMs with a single unit

Replace multiple desktop DMM units with a single MEMORY HiCORDER for measuring multi-channel sensors. Select from the MR8990 2-channel unit with a wide range, or the U8991 4-channel unit to measure multiple channels. In addition to reducing the number of units required, system simplification makes maintenance and management easier.

# 108 Benchtop DMMs

Expandable to a maximum of 108 channels using multiple 4-channel units

#### Comparison of DIGITAL VOLTMETER UNIT MR8990 and U8991

# Specifications for DC voltage measurements

Measure minute fluctuations in sensor output for automobiles or voltage fluctuations in batteries with high precision and at high resolution. The maximum voltage input is 500 V DC for the MR8990 and 100 V DC for the U8991. Both units also feature high input resistance.

# Real-time Save

# Save data while measurement is ongoing, even with extended recording, high-speed sampling, and numerous channels

The MR8740T offers real-time save functionality that saves data to recording media while measurement is ongoing. Hioki recommends using the instrument's large internal SSD unit when you need to record data for extended periods of time. If you wish to save data after measurement has completed, you can specify a USB drive as the save destination. Additionally, you can use the real-time save function to control how long the instrument can continue measuring without being dependent on the amount of built-in storage memory. Files are saved as 512 MB segments when using the real-time save function.

#### Real-time save capabilities when measuring 108 channels

| Save destination        | Number of channels | Sampling<br>speed | Supported measurement time | Maximum sampling speed<br>at which real-time saving is<br>supported*1 |
|-------------------------|--------------------|-------------------|----------------------------|---|
| Internal SSD (480 GB)   | 108 ch             | 500 kS/s          | About 1 hr.                | 5 MS/s (12 channels)  |
| USB Drive Z4006 (16 GB) | 108 ch             | 100 kS/s          | About 10 min.              | 1 MS/S (12 channels)*2  |

#### Saving data directly to your PC

Transfer measurement data directly to your PC by using the FTP sending function together with the real-time save function. This makes it easier to observe data after the measuring process.

# Long-term measurements for more efficient testing

The real-time save function boasts high-speed sampling and multi-channel measurements. Perform an approximately 1-hour measurement at 5 MS/s in 2 channels or 1 MS/s in 64 channels.

# **Complete Product Lineup**

### **Build Your Ideal Inspection System**

Choose from a diverse array of modules to build your perfect test system.

To test a ECU that requires multi-point, high-precision measurements, combine the U8975, U8978 and U8991 4-channel units to build a measurement system that delivers a maximum of 108 channels. In addition, create an integrated testing system that can simulate engine behaviors and sensors by utilizing the waveform generators, pulse generators, and VIR generators available on select units.

Use ANALOG UNIT 8966 and DIGITAL VOLTMETER UNIT MR8990 to supplement waveforms of high-speed and high-voltage signals, such as for inverter boards, in the same way as when measuring with a DMM. Combine high-precision units that perform simultaneous sampling for safe and reliable operation in a variety of measurement scenarios.

Unit interchangeability

Use any of the 18 types listed in the unit selection guide below.

The MR8740T is compatible with the same units used for the HIOKI MEMORY HICORDER MR8740, MR8741, MR6000, MR8827, and MR8847A.

### Generate voltage/current signals, pulses and simulated resistance

Use generator units in place of the sensor output for simulation testing or board testing lines using generated signals. Combine a generator unit and measurement unit to perform generation and measurement with a single test system.

### Ideal for testing that requires simulated signals

Generator units can simulate a variety of sensor signals

When used as an ECU testing device, generate simulated signals from various sensors, which is indispensable for testing electronic parts and maintaining equipment.

| ECU type                                 | Sensor function  | Sensor type           | Generator unit               |

#### **Testing electronic parts**

Use the recorder's internal voltage monitor and current monitor to test electronic parts. Or, check resistance values and diode direction characteristics based on the output current and measured voltage.

#### Testing and maintaining equipment

Easily maintain and test equipment involved in voltage and current measurements thanks to high accuracy output.

### Ideal for measurements that require simultaneity

All channels are equipped with an A/D converter and measurement timings are synchronized, eliminating sampling time difference between units and channels. This delivers accurate time measurement for cursor readout and time difference measurements.

#### Sampling in order from channel 1

Deviation when aligned on the same time axis

### Record briefly at high speed, record for a long time at low speed

Use high-speed sampling to capture inverter waveforms, and low-speed sampling to measure RMS values on multiple channels.

#### Maximum recording time to internal memory

# Instantaneous measurement of various inverter waveforms

Simultaneously measure and record multiple phenomena, such as the voltage, current, torque, and rotation signal on the primary and secondary sides of an inverter, from high voltage to minute voltage.

# Highly accurate measurement of RMS values over long periods of time

Use the high-resolution CURRENT UNIT 8971 for highly accurate

# Measurement and Analysis Functions

### Triggers that detect targeted events

Set triggers on any channel to record data whenever an event occurs. This setting can be configured for all channels.

| Level trigger        | Compares to one voltage value.                   |
|----------------------|--|
| Window trigger       | Compares to two voltage values.                  |
| Voltage drop trigger | Detects voltage drops in commercial power lines. |
| Period trigger       | Monitors periods.                                |
| Glitch trigger       | Detects anomalies in pulses.                     |
| Pattern trigger      | Compares when the logic signal is ON/OFF.        |

#### Setting multiple triggers for a single channel

#### Set up to 4 triggers for a single channel.

Sometimes the cause of issues are unclear, preventing you from setting up the proper trigger to capture the necessary waveforms and conduct further analysis. By being able to set glitch, level, windowin, and window-out triggers for the same input waveform, for instance, you can broaden the scope of your investigation and increase your chances of catching the signal anomalies.

Various triggers × Up to 4 Settable for any channel

Setting Screen with Easy-to-Understand Trigger System Chart

### Warning function using trigger settings

Trigger settings are used to issue a warning if the setting range is exceeded.

For example, during an immunity test, this function can be used to notify the user when the variable limit value of the measured voltage is exceeded. In such cases, a window out trigger is used.

#### **Output warning**

- (1) When a waveform exceeds the upper and/or lower limits of the setting range, an event mark is displayed on the screen and an alarm sounds. When the waveform is once again within the upper and/or lower limits of the setting range, the alarm stops and an event mark is displayed on the screen.
- (2) In each case, the time, channel, type of trigger, and voltage measurement value are displayed on the top right side of the screen. \* Effective for sampling at 100 KS/s or less.

#### When unsure about trigger level

#### Setting trigger level automatically

Take a preliminary measurement of a specified number of samples before the actual measurement, and use the average of those values to set the trigger level. This function is useful both for the warning function and for normal triggers.

Warning function settings are the same as for triggers, and easy to use.

Warning displayed at the top of the screen

### Calculation function with high analytical performance

#### Waveform processing

In addition to calculating numerical values such as average values and RMS values, up to 16 types of simultaneous processing are available by combining calculations in the waveform dimension with differential arithmetic, including the four arithmetic operations, between channels.

Simultaneously make up to 16 waveform calculations by combining the four arithmetic operations and 11 types of calculations

| Four arithmetic operations<br>(addition, subtraction, multiplication,<br>and division) | Parallel displacement along time axis<br>(SLI)                   |
|--|--|
| Absolute value (ABS)   | Differentiation (primary (DIF),<br>secondary (DIF2))             |
| Exponentiation (EXP)   | Integration (primary (INT),<br>secondary (INT2))                 |
| Common logarithm (LOG)   | Trigonometric functions<br>(SIN, COS, TAN)                       |
| Square root (SQR), cube root (CBR)   | Reverse trigonometric functions<br>(ASIN, ACOS, ATAN, ATAN2)     |
| Moving average (MOV)   | MR8990 DIGITAL VOLTMETER UNIT<br>time shift for PLC delay (PLCS) |

#### Numerical calculations

The measured waveforms are analyzed with numerical parameters. The MR8740T features several new numerical calculations including overshoot and undershoot calculations.

In addition to analog and logic channels, the recorder performs calculations on waveform processing results. It also features a numerical judgment function.

Simultaneous numerical calculations of up to 108 out of a total of 33 computations

| Average value         | Duty ratio                 |  |
|-----------------------|----------------------------|--|
| RMS value             | Pulse count                |  |

| Time to maximum value | Phase difference           |  |
| Minimum value         | High-level                 |  |
| Time to minimum value | Low-level                  |  |
| Period                | Median value               |  |
| Frequency             | Amplitude                  |  |
| Rise time             | Overshoot                  |  |
| Fall time             | Undershoot                 |  |
| Standard deviation    | +Width                     |  |
| Area value            | -Width                     |  |
| X-Y area value        | Burst width                |  |
| Specified level time  | Integration values         |  |
| Specified time level  | XY waveform angle          |  |
| Pulse width           |                            |  |

# Find a specific waveform within large amounts of measurement data

Set the peak values or trigger conditions you want to search for to have the relevant data retrieved and displayed automatically.

Our new Memory HiCorder HiConcierge function automatically calculates the characteristics of the reference waveform you have set and searches all of the measured data to detect any waveforms with low similarity as anomalous waveforms.

This drastically reduces the amount of time required to search for anomalies by eliminating the need to scroll through measured waveforms and checking them visually.

# Auto search of anomalous waveforms with Concierge

#### Memory HiCorder Concierge

A new waveform search function that finds anomalous waveforms in all of the measured data. This function is ideal for situations where it is difficult to set the right triggers before measuring because the nature of potential anomalies cannot be predicted.

### **Rich set of search methods**

#### Peak search

Search for the maximum value, minimum value, local maxima, or local minima in all of the measured data, and mark the search

#### **Trigger search**

Set trigger conditions for all of the measured data again to search for points where the conditions are fulfilled, even if no triggers

Memory HiCorder Concierge Waveform Search Screen

#### Jump

Jump to an event mark you made while measuring, to the cursor position on the display, or to the location measured at a 11

# Smart Links with Monitors and PCs

### Easily check measured waveforms and the settings of communication commands

During the design of an inspection system, a monitor and PC is needed to set communication commands and confirm that the measurement waveform is correct. You can check whether the setting information of the communication commands are accurately transmitted with the CMD ERR lamp on the main body. It is easy to further verify whether the measurement range (time axis and voltage axis), measurement time, triggers, and calculations are operating according to your settings. In this way, it's easy to build your ideal system.

 $^{\star}$  A display with a resolution of 1920 x 1080 or better is recommended.

#### Display system for efficient work

Configure various settings while viewing a variety of information on a single screen. Improve work efficiency by reducing the need to switch or scroll through screens in order to check the settings for each channel.

#### Waveform analysis with 8 cursors

When building a system or analyzing faulty parts, perform a detailed check of waveforms in order to verify proper operation. Use multiple cursors on the MR8740T to smoothly analyze and evaluate actual waveforms.

#### LabView compatibility NEW

The MR8740T can be controlled with LabVIEW. Search for "MR8740-50" under "Download Software" in the "Support" section of Hioki's website and download the LabVIEW driver.

Control the MR8740T with a single computer

Connect the MR8740T to a computer via LAN in order to control it with communication commands. This allows you to configure, generate, measure, and acquire data with only a single computer. After the testing system is built, remove the monitor for a more compact system.

# Standard recorder when control via PC is not required

If the unit will be used only as a basic recorder and there is no need to use a computer for control, use only the MR8740T together with a monitor to take and record measurements. Display the channel waveforms that are measured with the MR8740T on the monitor in

#### High-speed communication function A 1000 BASE-TX LAN terminal is equipped as standard.

#### FTP server function

The content of the MR8740T's memory (USB memory and internal SSD) can be copied to the computer.

# FTP transfer function

Measurement data can be transferred directly

# Interface

Rear

### LEDs indicate unit status

The POWER STANDBY lamp and DIAG lamp indicate the basic status. The CMD ERR lamp lights when an error or warning occurs.

| LED<br>name      | Color/<br>flashing   | Meaning when on  | How to turn off       |
|------------------|----------------------|--|-----------------------|
|                  | Orange               | Power standby  | Main power switch OFF |
| POWER<br>STANDBY | Green                | Power ON   | Activate switch OFF * |
|                  | O Green/<br>flashing | Power ON (warming up)                                    | Activate switch OFF * |
| DIAG             | See below            |  | -                     |
| CMD ERR Red      |                      | Syntax error in command<br>received, or warning occurred | *Goes off with CLS    |

\* If the POWER STANDBY lamp is steady or flashing green, do not turn the main power switch OFF.

#### DIAG LED Mode Table

| Display<br>order of<br>priority | Color/<br>flashing | Status  | Supplement   |
|---------------------------------|--------------------|---|--|
| 1                               | Red                | Ambient temperature too high<br>(environmental temperature<br>> 35°C/95°F)  |  |
| 2                               | Purple             | Ambient temperature too low<br>(environmental temperature<br>< 10 °C/50 °F) |  |
| 3                               | O Yellow           | CPU load factor 80 % or more  | The average load factor is<br>updated every 0.5 seconds. |
|                                 | O Blue             | The instrument is in the<br>trigger standby state.                          |  |
| 4                               | Green              | Recording in progress   |  |
|                                 | O Pink             | Recording finished  | New command received,<br>switches to normal display.     |
| 5                               | O White            | Normal operation in progress<br>(stopped)                                   |  |

### **Internal battery**

The MR8740T is equipped with a battery (sealed lead acid battery) for shutting down the Windows operating system when the power supply is cut off. This allows the unit to be shut down normally even when there is an unexpected power failure or a breaker trips.

\* The internal battery should be replaced regularly, according to the estimated service life indicated in the table above. If the service life is exceeded and a power outage occurs, Windows might not shut down normally, and if so Windows might not start up again normally. Therefore, it is important to replace the battery on a regular basis. At the recommend replacement lime, please contact your authorized Hioki

- 1 Space for units Max. 27 units can be installed Model 8973 can only be installed in slots 25 to 27
- 2 USB 2.0 connector x2 For connecting a USB memory stick, USB mouse, or USB keyboard
- 3 Activate button Activates the unit, or places it in standby
- 4 POWER lamp Indicates the unit is activated or in standby
- 5 DIAG light Indicates the status of the unit
- 6 Command error lamp Lights when a command error occurs
- 7 Air vents For reducing the internal temperature
- 8 PS2 connector Not operational with this system
- 9 USB 2.0 connector x2 For connecting a USB memory stick, USB mouse, or USB keyboard
- 10 COM terminal
- Not operational with this system

- 11 HDMI terminal For connecting to monitors using an HDMI cable Max. resolution: 3840 x 1260
- 12 VGA terminal For connecting to monitors using an RGB cable Max. resolution: 2560 x 1600
- 13 Display Port terminal For connecting to monitors using a Display Port cable Max. resolution: 4096 x 2160
- 14 1000 BASE-T connector For connecting to the network via a LAN cable
- 15 USB 3.0 connector x4 For connecting a USB memory stick, USB mouse, or USB keyboard
- 16 Audio terminals Not operational with this system
- 17 External control terminals For inputting various external signals to control the device
- 18 Model No., Serial No. Numbers for identifying the unit
- 19 Main power switch For turning the power ON or OFF \* Place the unit in standby before turning the power OFF.
- 20 Power inlet Connect the included power cord.

### **External control terminals**

Connect an external device to the external control terminal in order to use that external device to start and stop the measurements made by the unit.

| No. | Terminal name | Operation                                   |
|-----|---------------|---|
| 1   | GND           | -   |
| 2   | IN 1          | Start/stop measurements, save,              |
| 3   | IN 2          | forced termination, event input             |
| 4   | GND           | -   |
| 5   | OUT1          | Judgment output, occurrence of errors,      |
| 6   | OUT2          | busy, trigger standby                       |
| 7   | GND           | -   |
| 8   | EXT.TRIG      | Inputs signal as an external trigger source |
| 9   | TRIG.OUT      | Outputs a signal when triggering occurs     |
| 10  | GND           | -   |
| 11  | EXT.SMPL      | Inputs external sampling signals            |

## Analysis software

Wave Viewer Wv (Bundled software) Download free updates from the HIOKI website. The MR8740T ships standard with Wave Viewer Wv, an application for displaying and converting waveforms. The application allows you to review waveforms stored in binary data captured with the MR8740T on a PC and convert files to CSV format so that they can be loaded by Excel.

#### Q For details, see product information on Hioki's website.

### The MR8740T supports your testing technologies with

simultaneously sampled measurements across multiple channels.

#### Set examples

### Multi-channel measurement for ECU development

In addition to the measurement of 68 analog channels + 24 logic channels, the MR8740T can also generate waveforms on 4 channels, generate pulses on 8 channels, and output DC voltage/DC current/ simulated resistance on 40 channels. This allows the simultaneous testing of multiple points, such as for high-performance boards, with a single unit.
