¹ Absolute accuracy values at full scale on the analog input channels assume the device is operating within 70 °C of the last external calibration and are valid for averaging 100 samples immediately following self-calibration.

² Differential mode

³ Sensitivity is a function of noise and indicates the smallest voltage change that can be detected.

Analog Input Accuracy Formulas

*Absolute Accuracy = Reading * Gain Error + Range * Offset Error + Noise Uncertainty*

where

*Gain Error = Residual Gain Error + Gain Tempco * Temp Change from Last Internal Cal + Reference Tempco * Temp Change from Last External Cal*

*Offset Error = Residual Offset Error + Offset Tempco * Temp Change from Last Internal Cal + INL Error*

*Noise Uncertainty = (Random Noise * 3) / √100 for a coverage factor of 3 σ and averaging 100 points*

Absolute accuracy at full scale on the analog input channels is determined using the following assumptions:

Temp Change from Last External Cal = 70 °C

Temp Change from Last Internal Cal = 1 °C

Number of Readings = 100

Coverage Factor = 3 σ

For example, on the ±10 V range, the absolute accuracy at full scale is as follows:

*Gain Error = 115 ppm + 11 ppm * 1 + 5 ppm * 70*

Gain Error = 476 ppm

*Offset Error = 20 ppm + 44 ppm * 1 + 76 ppm*

Offset Error = 140 ppm

*Noise Uncertainty = (237 μV * 3) / √100*

Noise Uncertainty = 72 μV

*Absolute Accuracy = 10 V * 476 ppm + 10 V * 140 ppm + 72 μV*

Absolute Accuracy = 6,231 μV, rounds to 6,230 μV
