

Head Expander & Slip Table

When the size of the test parts is larger than the size of the moving coil of the electro-dynamic shaker, the addition of an auxiliary head expander and slip table can meet the customer's requirements for shaker expansion, increasing the test part installation area. The high-quality finishing casting process and the excellent material ratio ensure the extension table has a better strength-to-weight ratio and better frequency response characteristics.

ECON provides users with a complete range of slip table, head expander and other supporter, so users can make a one-stop supporting choice.
