

EIT[®] ON-LINE MEASUREMENT PRODUCT OVERVIEW

BROADBAND & LED

ON-LINE MONITORING SYSTEMS

EIT's On-Line Systems measure UV intensity to provide continuous, real-time, feedback on a system. The solution is electro-optic based and can be used to monitor the UV from LED or Broadband (mercury) sources in situations where:

- Space is limited and a radiometer will not fit
- Arms, rollers and/or blades are present
- Sources are enclosed, not easily accessed or high off the ground
- Multiple sources are used to increase production line width
- Fast production speeds make it hard to use a radiometer
- UV conditions change rapidly due to off-gassing and/or contamination
- High value products are manufactured and undetected changes in the UV can lead to high scrap levels
- Continuous validation of the UV conditions is required
- The process window is tight

Top: EIT Compact Sensor
Above: EIT DIN Rail

Applications include web presses, fiber optic draw towers, hard drive manufacturing, print and medical applications. The intensity measured by the On-Line Monitoring System is a relative intensity versus an absolute (W/cm^2) value. The user is able to track both gradual (e.g. source aging) or sudden (equipment malfunction) changes to the UV intensity to take action before the changes impact product quality and bottom line profitability.

The On-Line System consists of two components: Compact Sensor and DIN Rail Signal-Conditioning Unit. The system can be used as the sole means of UV process control or in conjunction with an EIT NIST-traceable UV radiometer.

EIT Compact Sensor: An extremely durable sensor with sealed optics designed to withstand harsh UV environments. Sensors are available for **LED** or **Broadband** based sources. EIT and our representative/distributor network will assist in selecting the optic response, housing shape, aperture size and mounting location based on the UV source type and application.

An EIT Compact Sensor mounted behind a UV reflector can provide continuous information on the lamp condition.

EIT DIN Rail: The Compact Sensor works with the EIT DIN Rail to provide a signal (0-10 volt or 4-20 milliAmp) proportional to the real time UV intensity. The signal from the DIN Rail allows the user to track the relative real-time intensity on a PLC or display. The DIN Rail also allows the user to set low limit alarms and/or close a relay if the pre-programmed limits are exceeded.

EIT DIN Rail units installed in cabinet to support multiple Compact Sensors used in production.

EIT COMPACT SENSOR DURABILITY

The Compact Sensor uses an innovative optics design to increase durability and reduce solarization (degradation of optical components) caused by intense UV energy. An EIT UVA Compact Sensor was tested for over 6,700 hours in an intense high power microwave UV system. The optics were characterized before and after the test. Results showed a very small decrease (4%) in the optical transmission characteristics.

The EIT Compact Sensor also has over twenty years of real world monitoring experience, making it the choice to monitor even the most intense UV sources without perceptible solarization.

The before and after scans of Compact Sensor optics after 6,700 hours of exposure to a high intensity microwave system

SENSOR INSTALLATION LOCATIONS

Selecting a location to install your Compact Sensor depends on your application and source. The Compact Sensor needs to remain clean and cool (< 100°C for UVA, UVB & UVV and < 70°C for UVC and LED Compact Sensors).

Installing the Compact Sensor where it 'sees' reflected energy is preferred to a location where it only 'sees' direct energy. Consider using the EIT Quartz Rod if physical access or high temperatures are a concern.

Suggested Sensor Installation Locations:

1. Behind the Reflector from top
2. Behind the reflector from side
3. Below the reflector looking up
4. Under system and/or quartz plate
5. End of lamp housing
6. Use of quartz rod or other material

COMPACT SENSOR INTERNAL APERTURE SIZE

The Compact Sensor internal aperture size is specified at the time of order and is determined by the type/power of the source, mounting location, angle of view to the source, housing type and whether or not an EIT Quartz Rod is used. EIT and our rep & distributor team will work to determine the best Compact Sensor for your application. We suggest testing Compact Sensors prior to placing a large order to insure optimal Compact Sensor performance and longevity.

EIT COMPACT SENSOR

Features

- Optics are extremely resistant to solarization and hermetically sealed to prevent contamination
- Small form factor, squared body for easy installation
 - ◊ The CS-1 (above left) housing has an optional air/nitrogen purge to keep the optics clean
 - ◊ The CS-2 (above right) housing is height reduced
- Available in **LED** (EIT L-365, L-385, L-395 or L-405) or **mercury** (EIT UVA, UVB, UVC or UVV) bands, specified at the time of order
- Internal aperture size determined by source type and Sensor mounting location
- Each Compact Sensor is supplied with 10 foot (3m) cable

EIT DIN RAIL

Features

- Signal conditioning unit used with Compact Sensor
- Continuously monitors the output of a single UV LED or lamp
- Provides 0-10 Volt **or** 4-20 milliAmp analog output with user-settable alarm points and relay closure output connections
- Snap-in DIN Rail mounting convenience
- Powered by 24 volts AC/DC

ELECTRO MAGNETIC INTERFERENCE (EMI)

UV equipment (e.g., high-frequency power supply, power supply mounted in with the UV source, microwave source) has the potential to generate Electro Magnetic Interference (EMI) or electrical noise. A Compact Sensor cable, even with its shield, can also pick up electrical noise if it is run alongside a high voltage line. This electrical noise can make it appear that either the sensor and/or the source is unstable. The EMI Compact Sensor and EMI DIN Rail have been 'hardened' with additional circuitry to make them less susceptible to electrical noise or interference.

EMI COMPACT SENSOR & EMI DIN RAIL

The EMI Compact Sensor is identified by the "gold" circle on the electronics. The EMI Compact Sensor must be grounded and connected to an EMI DIN Rail with a three wire EMI cable for it to work. *Note: If the EMI Compact Sensor is used with the Standard DIN Rail and/ or two wire cable, there is no added EMI protection.* EMI Compact Sensors are currently available in UVA, UVB, UVC and UVV versions. In addition to the CS-1 and CS-2 housings, the EMI Compact Sensor is also available in a "BTR" (Behind The Reflector) housing which mounts behind the reflector of a lamp.

Left to Right: EMI Compact Sensor with "gold" circle; EMI Sensor with 3 wire cable; EMI DIN Rail; EMI Housings (BTR , CS-1, CS-2)

| Feature | CS-1 With purge | CS-2 Without Purge | BTR (Behind the Reflector) | Standard DIN Rail DRM-007 | EMI DIN Rail DRM-006 |
|-----------------------------------|--|--|--|--|--|
| Size | 0.57 x 1.10 x 0.75" (1.45 x 2.78 x 1.91 cm) | 0.57 x 0.60 x 0.75" (1.45 x 1.52 x 1.91 cm) | 0.55 x 0.55 x 1.55" (1.40 x 1.40 x 3.90 cm) | 3.56 x 3.11 x 0.98" (9.04 x 7.90 x 2.29 cm) | 3.56 x 3.11 x 0.98" (9.04 x 7.90 x 2.29 cm) |
| Weight | 0.8 oz (22.68 g) | 0.7 oz (19.86 g) | 1.0 oz (28.35 g) | 3.6 oz (101 g) | 3.6 oz (101 g) |
| Material | Aluminum Housing | Aluminum Housing | Aluminum Housing | DIN Rail Housing | DIN Rail Housing |
| Available Sensor | Standard, LED or EMI | Standard, LED or EMI | EMI Only | Used with Standard or LED Sensor | Used with EMI Sensor Only |
| UV Bands/ Power Source | UVA/UVB/UVC or UVV L365/L385/ L395 or L405 | UVA/UVB/UVC or UVV L365/L385/ L395 or L405 | UVA/UVB/UVC or UVV | 20-28 Volts AC or DC 70 mA maximum | 20-28 Volts AC or DC 70 mA maximum |
| Operating Range (Temp °C) | UVA, UVB, UVV: 0-100°C UVC & L-Bands: 0-70°C | UVA, UVB, UVV: 0-100°C UVC & L-Bands: 0-70°C | UVA, UVB, UVV: 0-100°C UVC: 0-70°C | 0-50°C | 0-50°C |
| Sensor Aperture/ Output | Sensors are available in multiple aperture sizes, specified at time of order Aperture size used dependent on lamp power & mounting location | | | 0-10 VDC or 4-20 milli- Amp proportional to UV intensity | 0-10 VDC or 4-20 milli- Amp proportional to UV intensity |
| Cable Type | Standard or LED Sensor: 2 wire, Teflon shielded, 10' (3 m) standard EMI Sensor: 3 wire twisted, Teflon shielded, 10' (3 m) standard | | | At DIN: Two Wire | At DIN: Two Wire + EMI Sensor Grounded |
| Acceptance Angle / Accuracy | Approximate acceptance angle of 5° degrees | Approximate acceptance angle of 13° degrees | Approximate acceptance angle of 4° degrees | +/- 3% of full scale (10 Volts), Alarm Set Points +/- 5% from threshold setting | +/- 3% of full scale (10 Volts), Alarm Set Points +/- 5% from threshold setting |

EIT QUARTZ ROD

Some UV applications/sources have limited physical space and/or high temperatures which make it difficult to find a suitable location to install the Compact Sensor. The EIT Quartz Rod solves this challenge and allows the user to track the UV conditions while keeping the Compact Sensor cool. The EIT Quartz Rod is made of high quality quartz and is four inches (10 cm) long with a diffuse outer surface. The 0.2" (0.5 cm) diameter of the Quartz Rod allows it to fit into CS-1 housing with a set screw.

Top Left: Compact Sensor with Quartz Rod installed

Bottom Left: Quartz Rod illuminated with UV

Right: Close up of set screw holding the Quartz Rod into a CS-1 Sensor housing

CABLING

A Compact Sensor is connected to the DIN Rail with a supplied 10 foot (3 meter) Teflon shielded cable. *Standard & LED* Compact Sensors utilize a two-wire cable while *EMI* Compact Sensors utilize a three-wire cable. The cable from the Compact Sensor carries a low signal level and should be kept as short as possible and away from high voltage power lines. Longer cable runs should be done after the DIN Rail Signal Conditioning. Contact EIT to discuss stock/custom cable lengths and/or bulkhead connector options.

MERCURY COMPACT SENSOR RESPONSE

The Compact Sensor response for **mercury** sources is specified at the time of order from the choices below:

UVA (320-390 nm) UVB (280-320 nm)
UVC* (240-260 nm) UVV (395-445 nm)

EIT Mercury (Broadband) Responses: UVC, UVB, UVA, UVV

*The Compact Sensor UVC Response is 240-260 nm

LED COMPACT SENSOR RESPONSE

The Compact Sensor response for **LED** sources is specified at the time of order from the choices below:

L365 (340-392 nm) L385 (360-412 nm)
L395 (370-422 nm) L405 (380-432 nm)

EIT L-395 Response shown as an example

ABOUT EIT LLC

Founded in 1977, EIT provides contract electronic manufacturing & engineering services for medical, industrial, analytical instrument, telecommunications and aerospace customers from multiple facilities in Virginia and New Hampshire. EIT LLC designs, manufactures, sells, supports and services EIT radiometers and on-line measurement systems for industrial UV curing applications. EIT UV products have been sold since 1986 and are available for UV LED and Broadband (mercury) arc, microwave and spot sources.

EIT Products are designed and manufactured in the USA Product Specifications Subject to Change without Notice
