iCell technology for data protection and power cycling protection

SATA25000 is designed with voltage detector circuit. While abnormal power-off occurs, the detector circuit can detect the lower voltage caused by the sudden power shut off and get this feedback to SSD controller. Once SSD controller is received this feedback signal, SSD firmware will trigger the mechanism to write the data in the data buffer. As a result, iCell is able to provide power, even while power shut off, and there is no data loss happened to the SSD.

Integrated Thermal Sensor

As the speed of the SSD product get faster and faster, overall power consumption continues to increase. Accordingly, it brings a new concern: thermal management. The advantage of Thermal Sensor is that it will allow the SSD to either change the speed or throttle back on the flash accesses to allow the SSD to stay within temperature limits and prevent any reliability failures due to overheating.
